Equine Training Laryngoscope

ETL III – the third generation –

Head Mounted Overground Laryngoscope – Our invention and first publication of an equine training laryngoscope in 2007 was followed by many market requests. Taking our experiences from the first generation, we have developed a completely head mounted and modular system with the latest LED technology. It will allow even very young horses to be examined. Additional weight is just 950g on each side of the cheeks. The rider is not involved at all during the exam. Our recording and video transmission includes automatic audio. Mounting, fixation and dismounting is fast and uncomplicated. Service and replacements can be done immediately due to the modular construction.

- self-holding fixation
- mucus resistant video head
- head mounted system
- video and audio recording
- direct video processing and recording
- no data reduction
- remote controlled deflecting
- wireless video control
- flushing pump (manual/automatic)
- manual flush via syringe

Trocar cannulas with magnetic valve, safety trocars

Trocar cannulas are designed with different types of valves to reduce or to avoid CO² loss when changing instruments and telescope during laparoscopy and thoracoscopy. Our reusable and patented magnetic valve trocar system has several advantages compared to other valve types. First of all they are light in weight and because of the valve construction, the insertion of instruments and scopes will pass smoothly through with out scratching or touching the front lense like in a ball system or in a so called automatic valve system. In addition there is nearly no gas loss even when changing instruments. There are no mechanical parts to clean inside except the magnetic flap itself which is a great help to your staff.
